### **Productivity and Growth in CBO's Forecasts**

NABE Foundation, 12th Annual Economic Measurement Seminar Four Seasons Hotel, Washington, D.C.

Robert Shackleton Macroeconomic Analysis Division What is CBO and why does it produce an economic forecast?

How do CBO's forecasts differ from others?

How does CBO prepare its economic forecast?

# The Purpose of CBO's Macroeconomic Forecast

The forecast is used primarily as an input to CBO's federal budget projections and analysis of legislative proposals.

It is a 10-year forecast based on current law.

Current law may involve major changes in future policy. For example, in past years, current law implied a major shift in fiscal policy in 2013, with the scheduled expiration of certain tax cuts.

## **CBO's Approach to Forecasting**

CBO's approach involves projections of both **potential** (maximum sustainable) output and **actual** output.

The long-term projection of potential output is based on a neoclassical growth model, coupled with a near-term business-cycle projection using a standard macroeconometric model.

The estimate of potential output is based mainly on estimates of the **potential labor force**, the **flow of services** from the capital stock, and **potential total factor productivity**.

CBO uses data from a wide variety of sources to form its estimates.

$$Q_{NFB} = F[L_{NFB}, K_{NFB}, TFP_{NFB}]$$

#### Where

 $Q_{NFB}$  = Real GDP in the nonfarm business sector (NFB)

 $L_{NFB}$  = Index of hours worked

 $K_{NFB}$  = Index of real capital services from nine different types of capital assets

 $TFP_{NFR}$  = Total factor productivity (a residual)

## Nonfarm Business Total Factor Productivity Since 1990: Changes Since 2007

Note: Vertical bars indicate the duration of recessions.

## Revisions to Projected Potential GDP in 2017 From 2007 to 2014

#### **Percentage Points**

Reason for Change:	Recession and Weak Recovery	Reassessment of Trends	Revisions to Prerecession Data	Fiscal Policy and Other Factors	All Sources
Nonfarm Business Sector					
Potential labor hours	-0.7	-3.0	-0.3	1.2	-2.7
Capital services	-0.6	-0.7	0.2 *	-1.3	-2.4
Potential total factor productivity	-0.5	-0.7	-0.6	0.4	-1.4
Other Sectors	n.a.	-0.3	0.7	-1.0	-0.7
Total (Percent)	-1.8	-4.8	-0.1	-0.7	-7.3

[\* Value corrected on July 19, 2016]

## Key Estimates in CBO's Projection of Potential GDP, January 2015

Percent, by Calendar Year

	Historical Periods						Projection	
	1950- 2014	1950- 1973	1974- 1981	1982- 1990	1991- 2001	2002- 2014	2015- 2025	
	Overall Economy							
Potential Output	3.3	4.0	3.3	3.2	3.2	2.1	2.1	
Potential Labor Force	1.5	1.6	2.5	1.6	1.3	0.7	0.5	
Potential Labor Productivity	1.8	2.4	0.8	1.6	1.9	1.4	1.6	
	Nonfarm Business Sector (NFB)							
Potential Output	3.5	4.1	3.7	3.3	3.6	2.3	2.5	
Potential hours	1.3	1.4	2.4	1.6	1.2	0.4	0.6	
Capital services	3.7	3.9	4.1	4.0	4.3	2.4	2.9 *	
Potential total factor productivity	1.4	1.9	0.8	1.0	1.4	1.3	1.3 *	
Potential Labor Productivity	2.2	2.7	1.3	1.7	2.3	1.9	2.0	
Capital-Labor Ratio	2.4	2.5	1.7	2.4	3.1	2.0	2.5	
Memorandum:								
Potential output of other sectors	2.6	3.7	2.1	2.7	2.0	1.2	0.8	

## **Other Considerations**

Are there problems with the measurement of productivity growth (for example, computers, health care)?

How do public expenditures influence private-sector productivity and productivity growth?

How do labor quality improvements contribute to productivity growth?

How does productivity growth contribute to income growth, income shares, and the federal budget?
